Software Defined Radios

RABC Conference
Ottawa, 3 March 2004

Software Defined Radio

- **A wireless system whose operating modes and parameters can be changed or augmented post-manufacturing, via software.**
- *Based on an Open Architecture*

Radio Convergence

**Single
reconfigurable
radio platform**

SDR Evolution

- **Digital radios dates back to the early days of digital signal processors**
 - Protocol capability limited by processor's performance
- **Analog / Digital boundary being pushed towards the antenna with the emergence of higher performance processors**
 - General Purpose Processors (GPP), Digital Signal Processors (DSP), Field Programmable Gate Arrays (FPGA)
 - Analog-to-Digital and Digital-to-Analog converters
- **Re-programmability of devices provides increased radio control and support for multiple waveforms**

SDR Evolution (cont.)

- **Today, waveform implementation is specific to a company, department or even program**
 - Programming languages
 - Operating systems
 - Device interfaces
 - Message formats
- **Limits of today's digital radios**
 - Limited portability of software components from platform to platform
 - Limited code reuse
 - Limited interoperability

SDR Evolution (cont.)

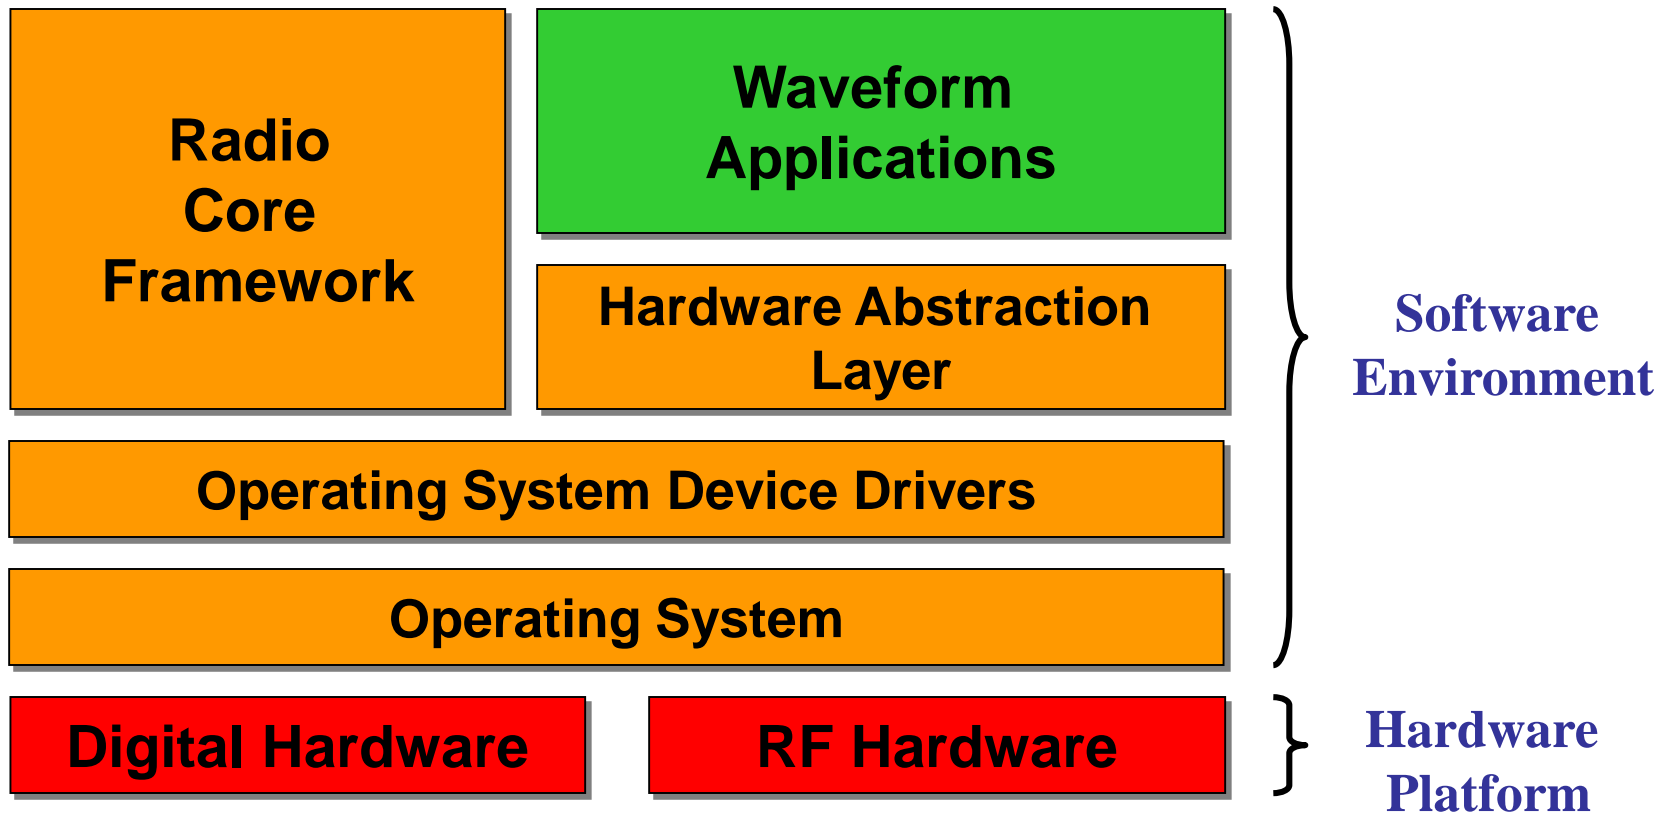

- **SDR must standardize the implementation process**
 - Open standard software architecture
 - To support interoperability, scalability, upgrades
 - Standard service definition
 - Load, setup, monitor, control,...
 - Standard Application Programming Interfaces (API)
- **Software reuse becomes a key factor**

SDR – A Paradigm Shift

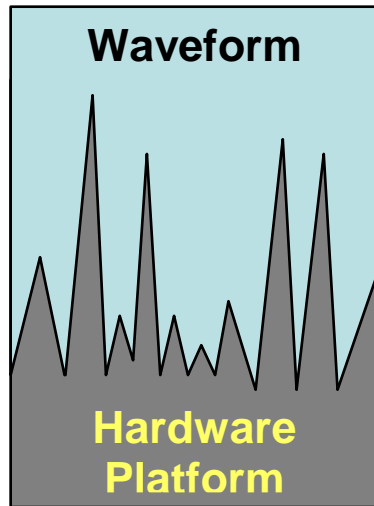

- **SDR is a paradigm shift in radio development**
 - **Decouples hardware, software and system integration functions**
 - Facilitates acquisition process by eliminating stovepipe systems
 - **Promotes re-use of signal processing software modules**
 - Modulator, demodulator, encoder, interleaver, FFT...
 - Reduces application development cost
 - **Open framework architecture**
 - “Glues” the software and hardware
 - Facilitates application and module portability
- **SDR is essentially a GPP-enabled digital radio based on an open architecture**

- **Central radio software piece, the “operating system”**
- **Provides an abstraction between software and hardware**
 - Defines interfaces, behavioural specifications and general rules to support devices and application portability
- **Based on commercial standards**
 - X.731 ITU/CCITT OSI System State Management
 - CORBA (Common Object Request Broker Architecture)
 - Posix (Portable Operating System Interfaces)
 - CCM (Corba Component Model)
- **Designed to meet commercial as well as military application requirements**

SDR becoming

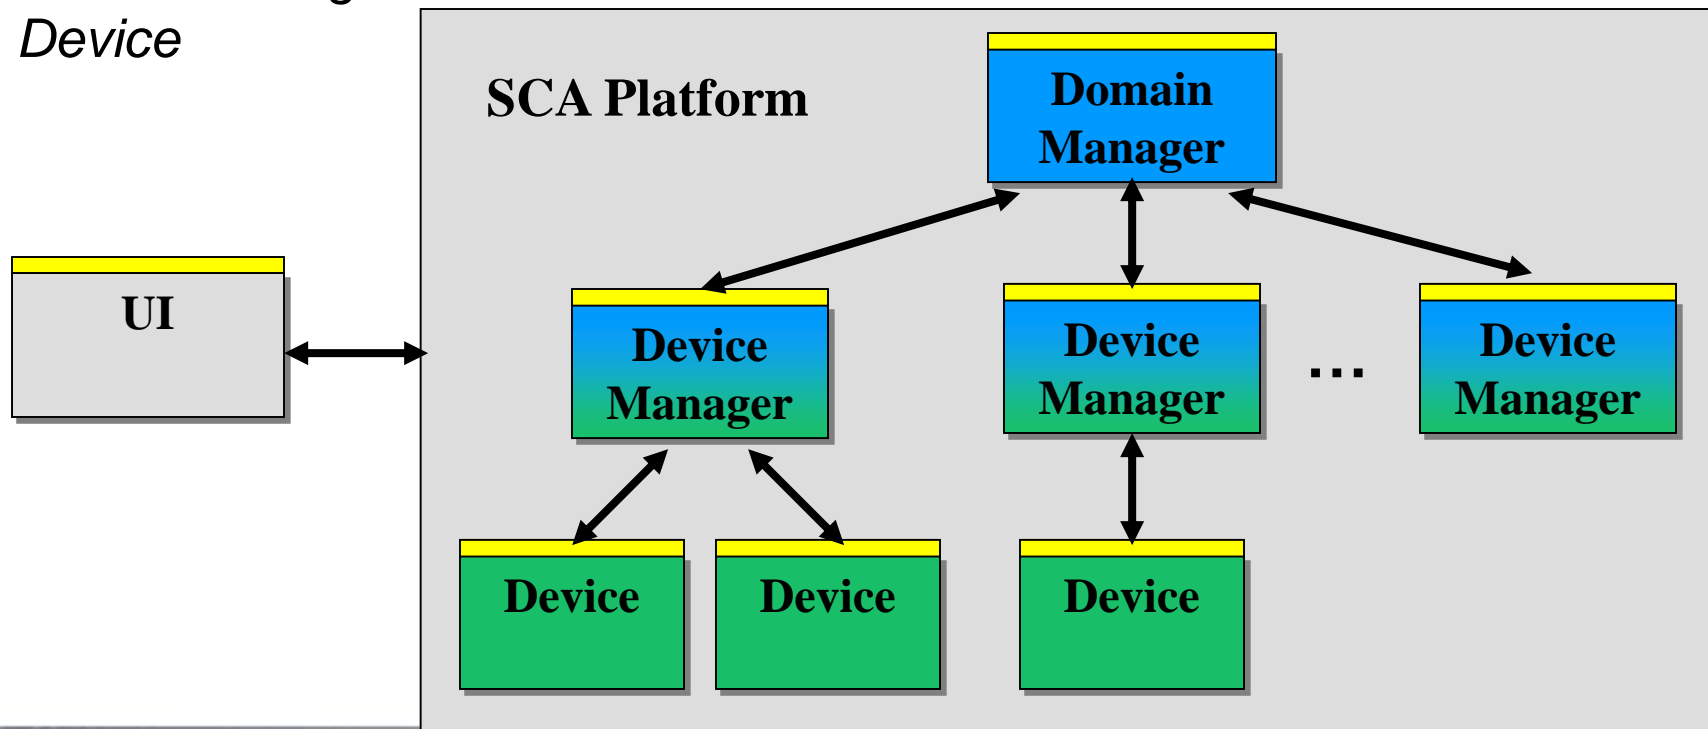

SCA Design Concept

SCA Platform

For the platform developer, the SCA is composed of three major types of components:

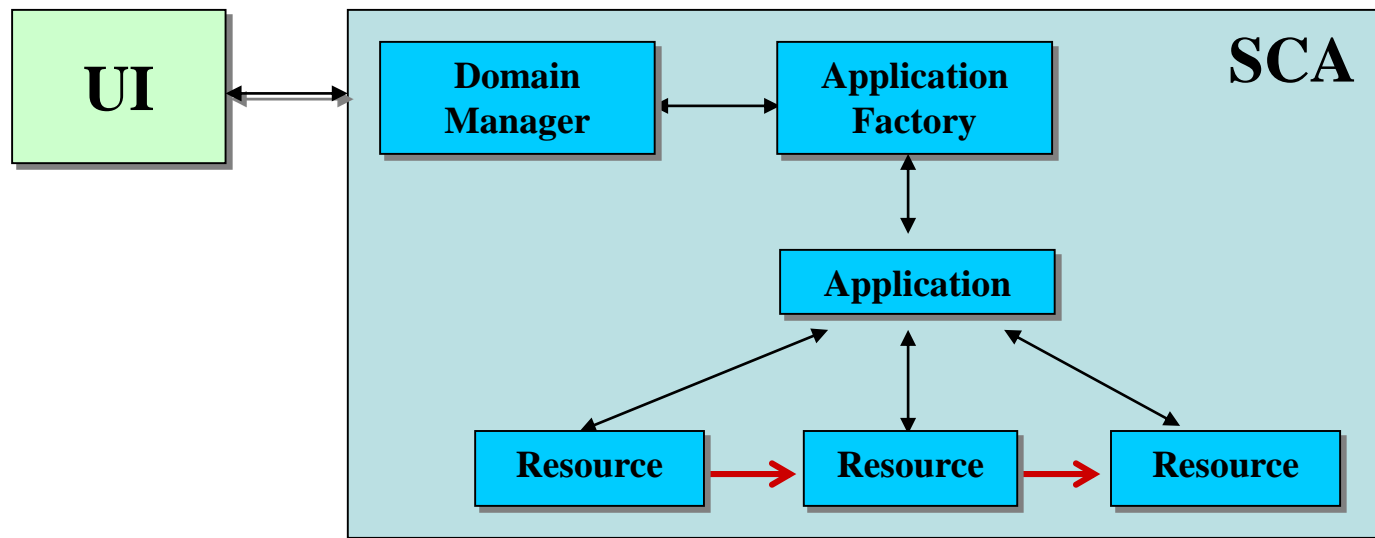

- *Domain Manager*
- *Device Manager*
- *Device*

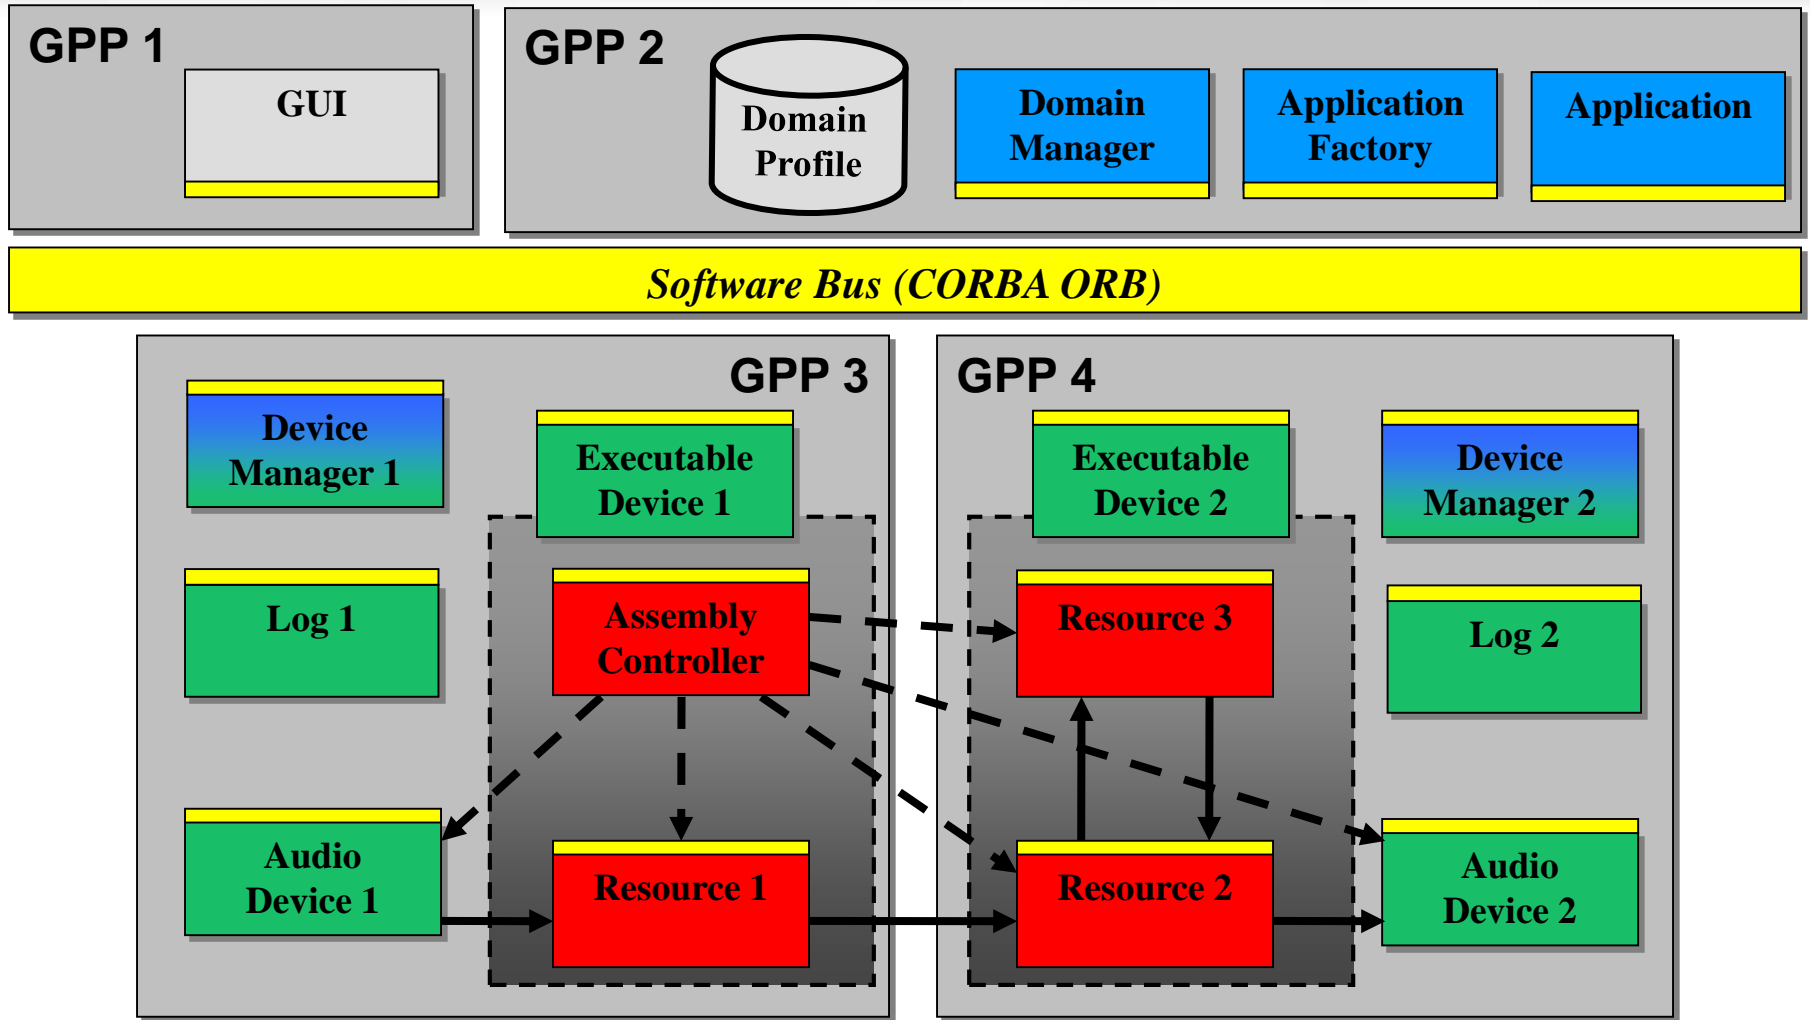

SCA Application

For an application developer, the SCA is composed of three major type of components:

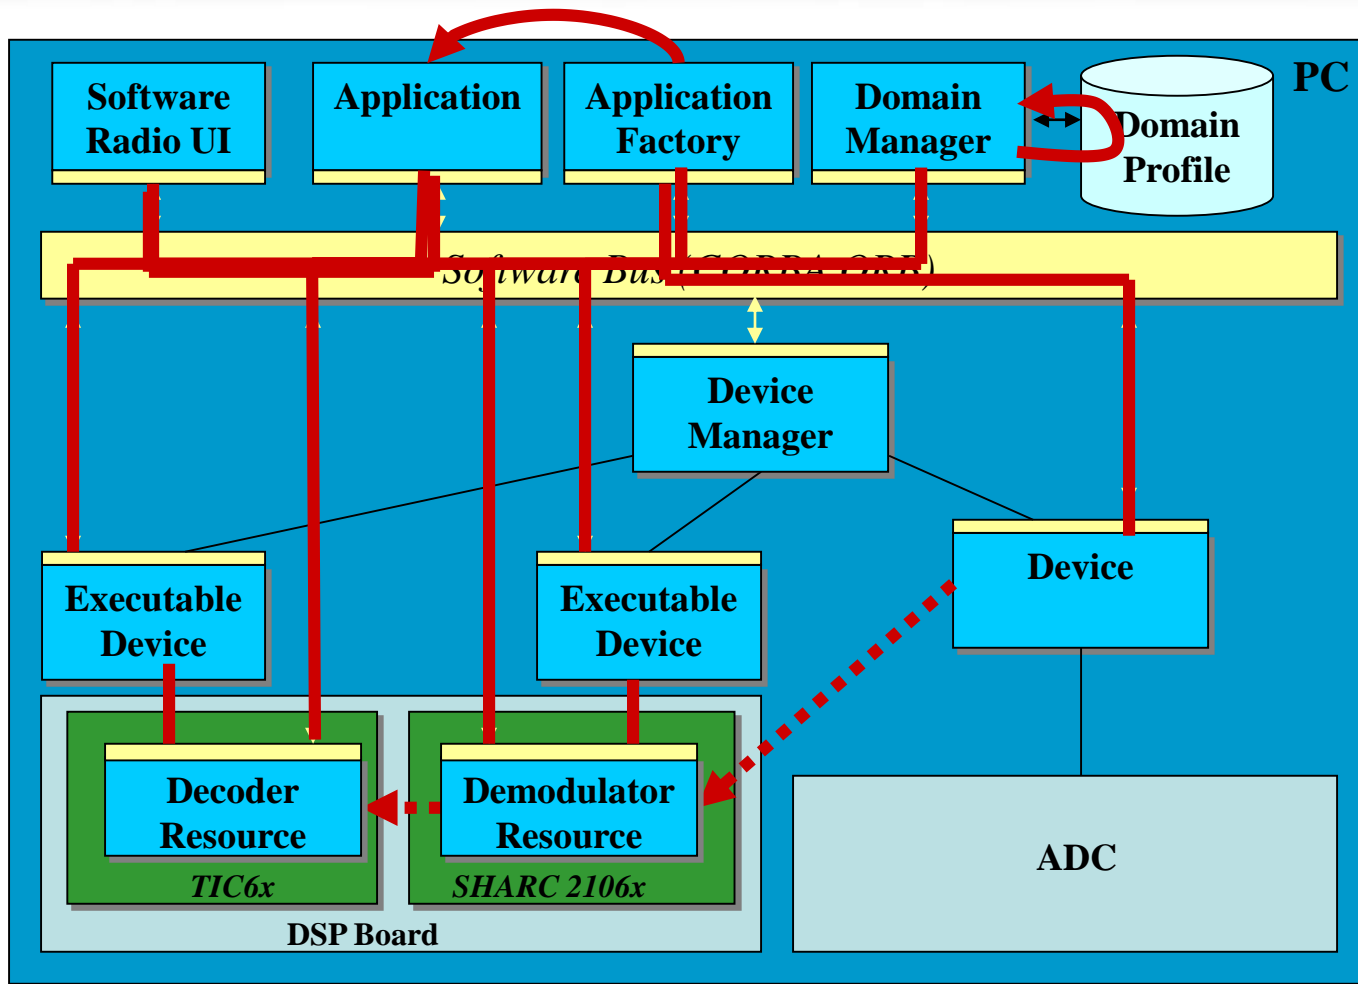

- *Application Factory*
- *Application*
- *Resource*

SCA Radio Platform

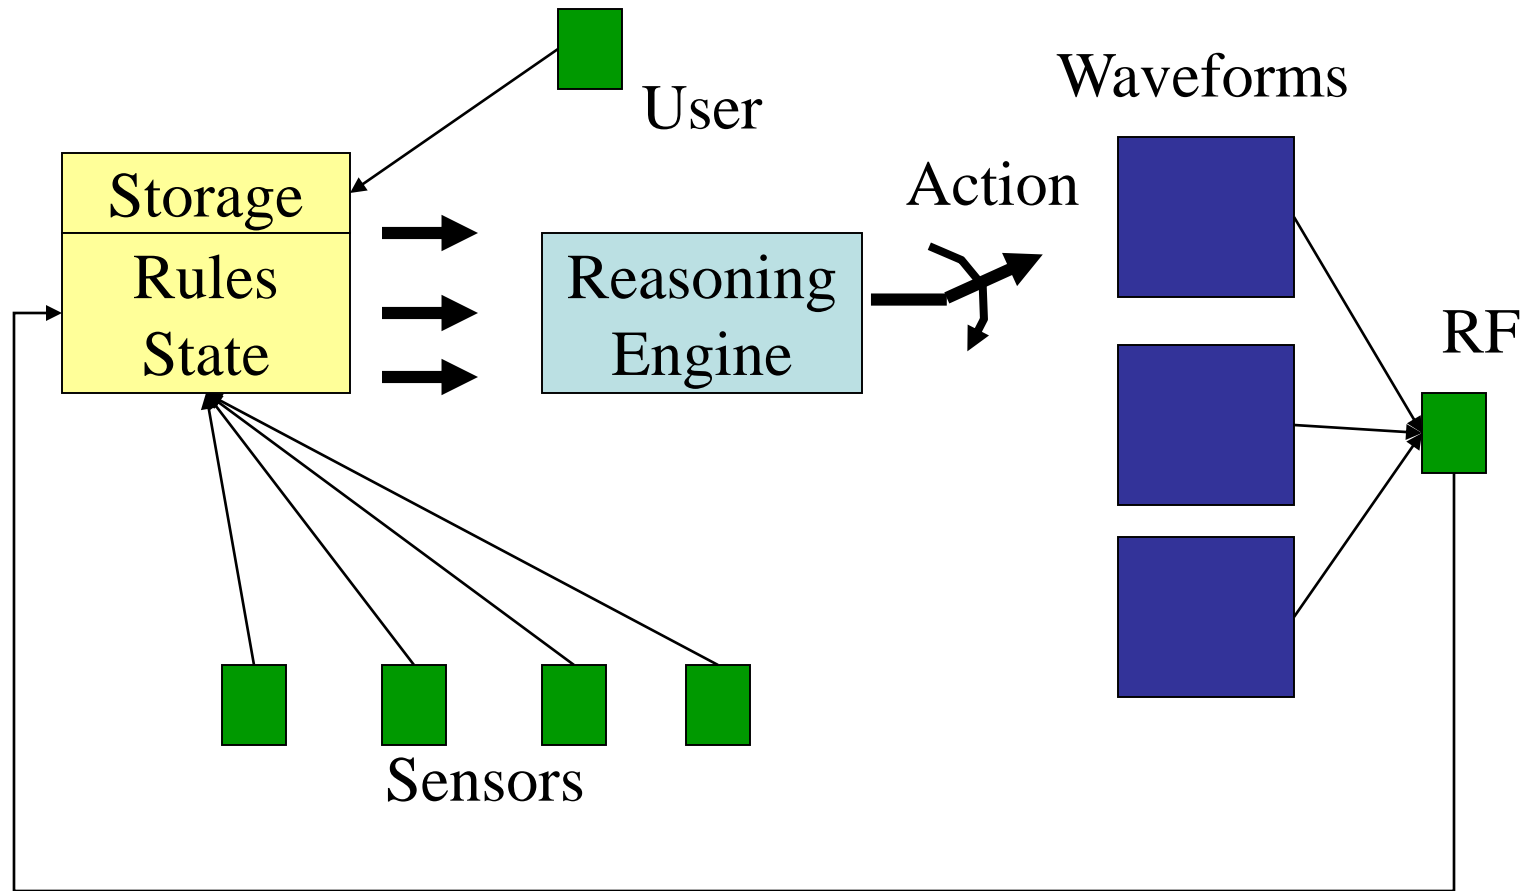

SCA Application Deployment

- **Software Defined Radio Characteristics**
 - Reconfigurability
 - Adaptability
 - Reuse of software

- **Cognitive Radio Characteristics**
 - Sense its physical environment surrounding via various sensors (GPS, meteorological, including RF)
 - Model-based reasoning engine
 - Rules for reasoning
 - Learning and adaptive capability

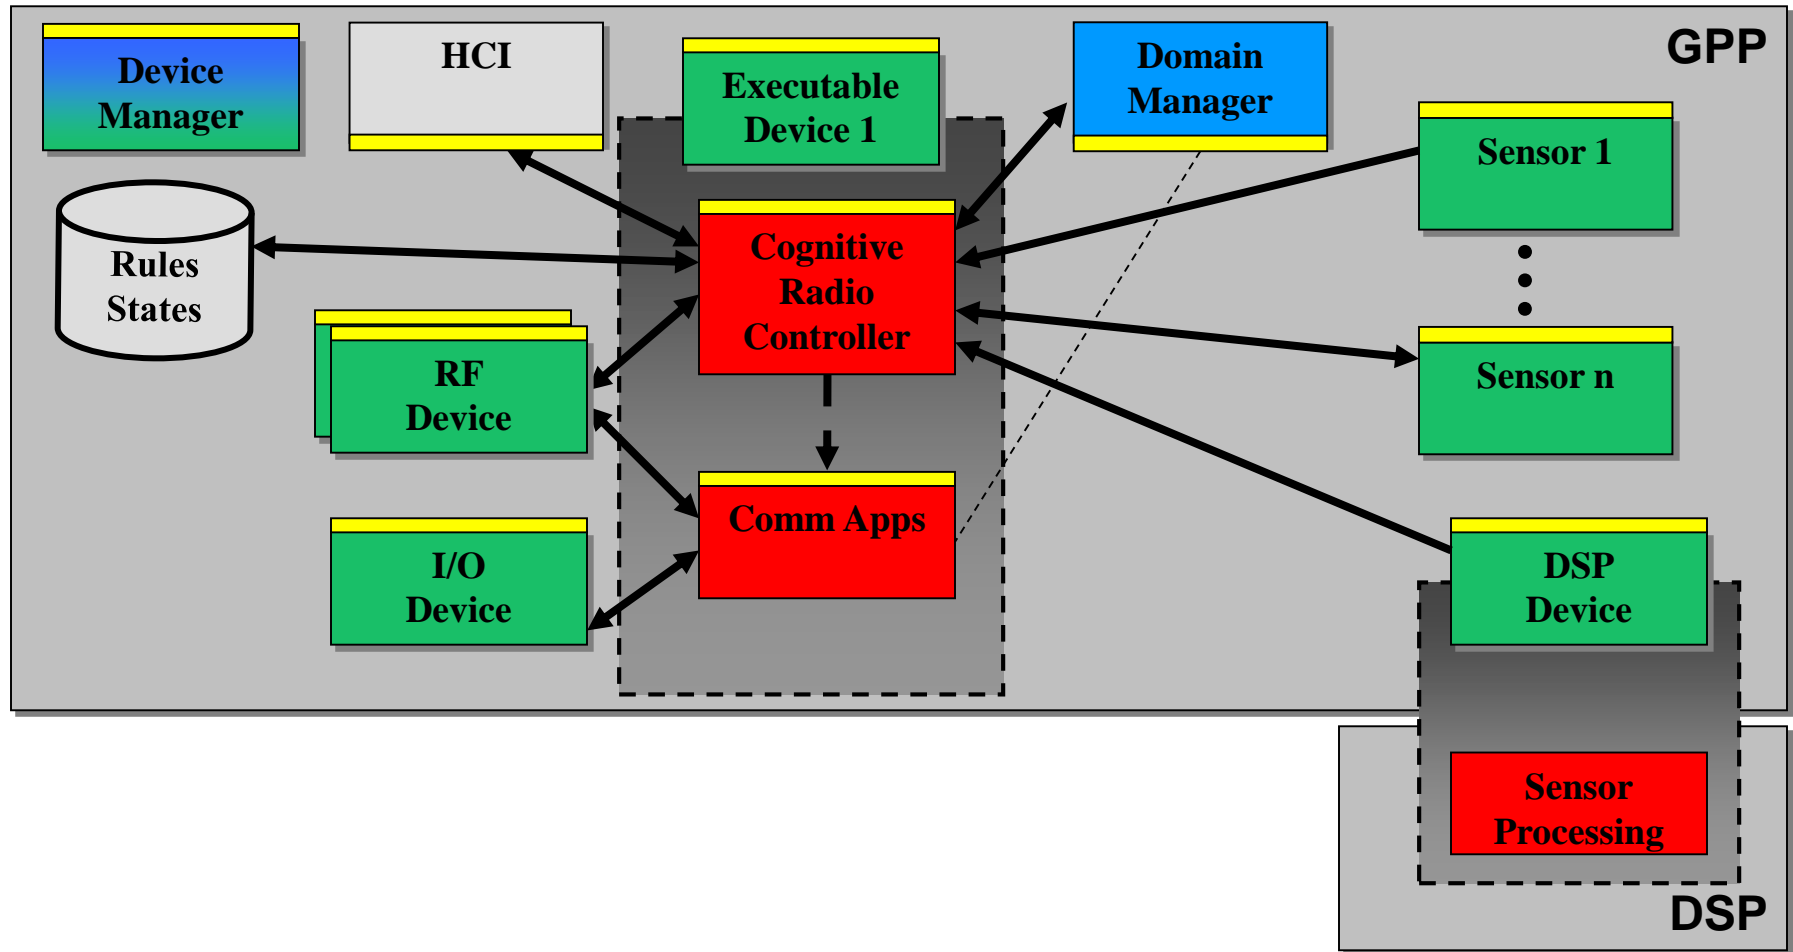

Cognitive Radio Simplified Architecture

CSDR Makes Sense !

- **All the advantages for radio to be software defined are applicable to a cognitive radio**
 - Add flexibility of changing communication waveform or protocol
 - Instantiate application on the fly from a large pool of waveforms
 - Is adaptable in software to support new communication waveforms

CSDR Architecture

CRC and SDR

- CRC developed and Open Source Reference Implementation of the SCA (i.e. SCARI)
 - Over 7000 downloads worldwide
- CRC continues to develop software to promote the expansion of the Software Defined Radio

SDR Development Tools

- Waveform Application Builder (WAB)
- Waveform Optimizer
- Radio Manager
- Node Boot Builder

SCA Core Framework v2.2

- SCARI-2 (all Java)
- SCARI-2 Hybrid (Java and C++)
- SCARI++ (all C++)

Conclusion

- SDR offers the flexibility to reprogram the radio at will
- SDR Open Architecture allows
 - Third party development
 - Wider proliferation of the technology
 - Lower cost
- Merge of Cognitive functionalities into SDR
- CRC remains at the forefront of the technology development
